

# Set Cover Problem

---

**Given:**

A Universe  $U$  of  $n$  elements

A collection of subsets of  $U$ ,

$$S = \{S_1, S_2, \dots, S_k\}$$

A cost function  $c: S \rightarrow \mathbb{Q}^+$

**To Find:** A minimum cost subcollection of  $S$  that covers all elements of  $U$ .

# Some Notations and Definitions

---

$C$  : set of elements already covered at the beginning of an iteration.

Cost Effectiveness of  $S$ : Average cost at which it covers new elements, i.e.  $c(S) / |S-C|$ .

Price of an element: Average cost at which it is covered, i.e.  $\text{price}(e) = c(S) / |S-C|$ .

# Greedy Set Cover Algorithm

---

1.  $C \leftarrow \Phi$
2. While  $C \neq U$  do
  - Find the most cost-effective set in the current iteration, say  $S$ .
  - Let  $\alpha = \frac{\text{cost}(S)}{|S - C|}$ , i.e., the cost effectiveness of  $S$
  - Pick  $S$ , and for each  $e$  in  $S - C$ ,  $\text{price}(e) = \alpha$
  - $C \leftarrow C \cup S$
5. Output the picked sets.

The greedy algorithm is an  $O(\log n)$  factor approximation algorithm: Proof Skipped.
