

Computer Basics

What is a Computer?

An electronic device that stores, retrieves, and processes data, and can be programmed with instructions. A computer is composed of hardware and software, and can exist in a variety of sizes and configurations.

Hardware & Software

The term hardware refers to the physical components of your computer such as the system unit, mouse, keyboard, monitor etc.

The software is the instructions that makes the computer work. Software is held either on your computers hard disk, CD-ROM, DVD or on a diskette (floppy disk) and is loaded (i.e. copied) from the disk into the computers RAM (Random Access Memory), as and when required.

Types of Computers

Mini and Mainframe Computers

Very powerful, used by large organisations such an banks to control the entire business operation. Very expensive!

Personal Computers

Cheap and easy to use. Often used as stand-alone computers or in a network. May be connected to large mainframe computers within big companies.

Hardware Components

Input Devices -- "How to tell it what to do"

- A keyboard and mouse are the standard way to interact with the computer. Other devices include joysticks and game pads used primarily for games.

Output Devices -- "How it shows you what it is doing"

- The monitor (the screen) is how the computer sends information back to you. A printer is also an output device.

Main Components

- Hardware
- Software
- Information Network/ Network

Computer Hardware

- Hard Drive
- Motherboard
- Sound Card and Video Card
- Memory Card
- Power Supply
- NIC Card
- BIOS

Look at this picture of a computer. A computer is made up of many parts. Let's explore the parts to see if you know what they are called!

The Monitor

The monitor looks like a TV and lets you see your work and your files.

The CPU

CPU stands for "Central Processing Unit". They contain the brains of the computer. They can be **desktop** models that the monitor sits on top of, or **tower** models that stand up tall.

Floppy Disk Drive

The CPU has places to insert disks. One kind of disk drive is a floppy disk drive. A floppy disk drive reads information from a very thin, floppy disk inside a hard plastic case. Floppy disks can hold up to 1.44 megabytes of information.

CD-ROM Disk Drive

CD-ROM stands for Compact Disk-Read Only Memory. They are flat, shiny disks that store information. Most new computers have CD-RW drives. CD-RW stands for Compact Disk-ReWrite. This type of disk allows you to write information to it, as well as read from it. Most can hold up to 700 megabytes of information.

DVD Drive/Burner

The newest computers come with the option of a DVD drive. A DVD (Digital Video Disc) looks just like a CD, but holds much more information! They can store 4.7 gigabytes of data!

Flash Drive

A Flash Drive is a relatively new storage device. It's like a mini, portable hard drive! You plug it into the USB (Universal Serial Bus) port on the front of newer computers and you can save to it!

How Do Computers Work?

- Input--This is when information is entered into a computer. Some common input devices include the keyboard, mouse and scanner.
- Output--This is the information that comes out of a computer after it has been processed. The information comes out on output devices such as a printer or computer monitor.
- Processing--This is when the information is handled by the computer's brain, known as the CPU (Central Processing Unit).

Input Devices

The Keyboard

The keyboard is probably the most used input device. It operates a lot like a typewriter, but has many additional keys that let it do special things a typewriter can't.

Special Keyboard Keys

The flashing light on the computer screen is called the cursor. This cursor can be moved up and down or left and right by pressing the 4 keys that have arrows on them. These arrow keys are called **cursor keys**.

Shift Key

When this key is pressed at the same time you press a letter key, a capital letter appears on your screen. When it is held down when you press a key with a symbol and number, the top symbol appears on the computer screen. There are two shift keys on your keyboard.

The Backspace Key

When this key is pressed, the cursor moves back one space to the left on your computer screen. This key is very helpful when you press the wrong letter or number. You can erase your mistakes!

The Caps Lock Key

When you press this key, a small light on the keyboard comes on. Whenever this light is on, any letter key you press will result in a capital of that letter appearing on the screen. Pressing the CAPS LOCK key a second time turns it off.

The Space Bar

This is the long bar located at the bottom of the keyboard. Every time you press this bar, the cursor moves one space to the right on the computer screen.

The Enter Key

When you write a letter or a story pressing the Enter Key makes the cursor jump down to the next line. This is a very helpful key to use when you want to start a new paragraph or you're typing your spelling list.

The Function Keys

Most computer keyboards have between 10 and 12 function keys. These keys are usually located at the top of the keyboard and give the computer user fast ways to give the computer special instructions. For example, pressing F1 when using a Windows program will allow the user access to the Help screen.

The Numeric Keypad Keys

On the right side of the keyboard there is a set of keys grouped together in a square. These keys have two functions. When the number lock key is pressed, these keys offer a quick and easy way of entering numbers into the computer. When the number lock key isn't pressed, these keys control the movement of the cursor.

Text Editing Keys

Located next to the numeric keypad, there are six text editing keys. These keys are designed to be used in Word Processing programs. They allow you to move quickly around a screen when you are writing a letter or story. They are very useful when you want to fix a spelling mistake, add a sentence to your work, or just move to another page.

The Mouse

Nope, it's not a rodent! It's another input device. It's called a mouse because of it's shape and the way the cable attaching it to the computer looks a bit like a tail. There are two kinds of mice. Some use a roller ball that allows the mouse to roll around a flat surface. When you do that and look up at the screen, you'll see a small moving arrow. This arrow is called the pointer.

A laser mouse doesn't have a roller ball. It uses a laser light that makes the pointer move. Laser mice don't have to have their insides cleaned!

Scanner

A scanner is a very useful input device. You can place a page of writing or pictures in the scanner and it will send the information to your computer. There they can be changed, saved into a computer file, or printed.

Printers

One output device is a printer. Once a computer user has created something on the computer, such as a story, he can send it to the printer. The printer prints exactly what's on the screen.

Two Common Types of Printers

An inkjet printer usually prints in color. It prints by squirting out small dots of ink onto the paper.

A laser printer uses a laser beam to create an image that is transferred to paper. It uses toner and a drum. The ink is powder.

Output Devices

- Printers
- Soundboard
- Audio Speakers

Soundboards

A soundboard is an electronic circuit board, located inside the computer, that can produce music and high quality sounds. If you play video games and multimedia programs on your computer, you'll need a soundboard!

Speakers

Speakers can be connected to your computer so you can hear very realistic sound effects and wonderful music. Some computer monitors come with built in speakers.

Computer Processing

Once information has been sent to a computer by one of the input devices it's processed. The computer uses it's brain to process the information. The computer's brain is called the CPU, or Central Processing Unit.

The CPU is also called the microprocessor. The word "micro" means small. Since the CPU is located on a small computer chip about 1 inch square, that makes sense!

Random Access Memory

When a computer processes information, it uses software programs. Each program requires a certain amount of electronic memory, or RAM (Random Access Memory) to run correctly.

RAM is temporary memory. The computer holds information in this memory and gets it when it needs it.

If a computer has more RAM, it can solve problems and process information faster! If you're updating your computer, more RAM is a great thing to add!

Read-Only Memory

A second kind of computer memory is ROM, which stands for Read-Only Memory. This memory is **permanent**. The information there was put there when the computer was made. The computer needs the information in it's ROM memory in order to function.

What are all those parts inside my computer and what do they do???

Hard Disk Drive

The Hard Disk Drive is a magnetic storage device. All the computer programs and files you create and save are located there. This is **permanent storage** (at least until you uninstall software or delete a file). The hard drive is normally signified by the drive letter "C". Today's hard drives can store a HUGE amount of information. A new computer might have a hard drive that will hold 160/320 GB's of Data.

Inside the Hard Disk Drive case you'll find circular disks that are made of steel. On the disks, there are many tracks, or cylinders. An electronic reading device called the head passes back and forth over the cylinders, reading information from the disk or writing to it.

Hard Disk Drives use Magnetic Recording Techniques. The magnetic medium can be easily erased and rewritten and will "remember" the magnetic flux patterns stored on it for many years!

Hard Disk Drives can spin at 7200 or more rpm's (Revolutions Per Minute). That means in one minute, the hard drive spins around more than 7200 times!

The Motherboard

Your computer couldn't work without the **motherboard**. It ties everything together! It allows every part of your computer to receive power and communicate with each other. Everything that runs the computer or enhances it's performance is either part of the **motherboard** or plugs into one of it's expansion slots or ports.

Sound and Video Cards

Sound and Video Cards are Output Devices. They contain special circuits that allow your computer to play sounds and display graphics on your monitor.

Memory Card

<u>Remember RAM (Random Access Memory)</u> and ROM (Read-Only Memory)?

RAM cards will remember what you tell them and can even change to remember new information. But, when the computer is turned off, it forgets everything you did! That's why you always save your work!

ROM is good at remembering, but cannot change it's mind. It holds the information that was built into it!

Power Supply

If there is any one component that is absolutely vital to the operation of a computer, it is the power supply! Without it, a computer is just a box full of plastic and metal. The power supply converts the alternating current (AC) line from your home or school to the direct current (DC) needed by the computer.

You can see the power supply from the back of your computer because of the power cord and the cooling fan.

Computers put out a LOT of heat and need the fan to keep them from overheating.

Network Interface Card

A NIC card (Network Interface Card) allows your computer to talk to other computers! A cable called Cat5 is plugged into the NIC card and your computer can then be attached to a network and be on the internet!

BIOS CHIP

A BIOS chip (Basic Input Output System) is a very important computer component. In simple terms, the BIOS chip wakes up the computer when you turn it on and reminds it what parts it has and what they do!

Bytes, Kilobytes, Megabytes and Gigabytes

- Byte 8 Bits=1 byte
- KB Kilobyte=1,000 bytes
- MB Megabyte=1,000,000 (1 million) bytes
- GB Gigabyte=1,000,000,000 (1 billion) bytes

I've heard those words, but what's a Byte??

All the information that moves through your computer is based on 2 commands. That's all, just two. The two commands are ON and OFF. They are symbolized by 1's and 0's.

That's right! The only information your computer can understand is ON (1) and OFF (0)! The millions of combinations of those two commands given in series are what makes your computer work.

The memory chips in your computer are divided into thousands of tiny compartments called **bits**. Each and every bit has an electronic switch, or gate. ON means the gate is open and letting electricity through.

Remember, the computer reads ON or open bits or switches as the number 1. Closed switches are OFF because electricity can't get through. The computer reads OFF bits or

switches as 0.

It is by grouping these bits together to form 1/0 commands that data is formed. Remember bytes? Eight bits are grouped together to form one byte. In that group of 8, there are 256 possible combinations of 1/0. Wow!! The grouping of 1/0 within a byte is called Binary Code. Binary Code is the language of computers.

Here is an example of Binary Code: when you type in the letter A on your keyboard, electrical signals are sent from the keyboard to the CPU. The CPU turns the signals into Binary Code. Then the computer reads the code and sends it on to the monitor to display the letter A. All of that happens in an instant!

So what about Megabytes and Gigabytes???

Megabytes and Gigabytes

One megabyte equals one million bytes. So, a computer with 512 megabytes of RAM (Random Access Memory) means the computer can handle 512,000,000 (512 million) bytes of RAM.

Hard disk space is also measured in bytes. So, a 200 GB Hard Disk Drive has 200,000,000,000 (200 billion) bytes for storing memory!

To get an idea of how much on/off (1/0) data a computer can store, imagine pressing any key 1 billion times. How long would it take?

You would have to press a key 5 times a second non-stop for over 6 YEARS to reach 1 billion keystrokes.

One billion keystrokes equals just 1 GB of memory!

Operating systems software

The operating system is a special type of program that loads automatically when you start your computer.

The operating system allows you to use the advanced features of a modern computer without having to learn all the details of how the hardware works

The link between the hardware and you, the user

Makes the computer easy to use without having to understand bits and bytes!

Applications software

An application program is the type of program that you use once the operating system has been loaded.

Examples include word-processing programs, spreadsheets and databases

Application Software

- Word processing applications
 - Microsoft Word
 - Lotus Word Pro
 - WordPerfect
- Spreadsheets
 - Microsoft Excel
 - Lotus 123
- Database
 - Microsoft Access
 - Lotus Approach

Application Software

- Payroll
 - Sage software
- Presentation tools
 - Microsoft PowerPoint
 - Lotus Freelance
- Desktop publishing
 - Abode Photoshop
- Multimedia applications
 - Microsoft's Encarta CD-ROM based encyclopaedias

Information Network

- LAN
 - A LAN (Local Area Network) is a system whereby individual PCs are connected together within a company or organization
- MAN
 - A MAN (Metropolitan Area Network) allows you to connect to other computers within the same city
- WAN
 - A WAN (Wide Area Network) as the name implies allows you to connect to other computers over a wider area (i.e. the whole world).

Information Network

Uses of Network

If ten people are working together within an office it makes sense for them all to be connected.

- In this way the office can have a single printer and all ten people can print to it.
- In a similar way other devices such as modems or scanners can be shared.
- Even more useful is the ability to share information when connected to a network.

Uses of Computer

PC at Home

Common uses for the computer within the home

- Computer games
- Working from Home
- Banking from Home
- Connecting to the Web

Uses of Computer

Computers in Education

- CBT (Computer Based Training)
 - Computer Based Training (CBT) offers a low cost solution to training needs where you need to train a large amount of people on a single subject.
 - These programs are normally supplied on CD-ROM and combine text, graphics and sound.
 - Packages range from general encyclopaedias right through to learning a foreign language.

Uses of Computer

Office Applications

- Automated Production Systems
 - Many car factories are almost completely automated and the cars are assembled by computer-controlled robots.
 - This automation is becoming increasingly common throughout industry.
- Design Systems
 - Many products are designed using CAD (Computer Aided Design) programs to produce exact specifications and detailed drawings on the computer before producing models of new products.
Uses of Computer

Office Applications

- Stock Control
 - Stock control is ideal for automation and in many companies it is now completely computerized.
 - The stock control system keeps track of the number of items in stock and can automatically order replacement items when required.
- Accounts / Payroll
 - In most large organizations the accounts are maintained by a computerized system.
 - Due to the repetitive nature of accounts a computer system is ideally suited to this task and accuracy is guaranteed.

Uses of Computer

Computers in Daily Life

- Accounts
- Games
- Educational
- On-line banking
- Smart ID cards
- Supermarkets
- Working from home (Tele-working)
- Internet

Create a Good Working Environment

- Frequent breaks away from the computer
- Appropriate positioning of screens, chairs and keyboards
- Provision of adequate lighting and ventilation.

Nitin Dawar, Delhi University Computer Centre nitin@ducc.du.ac.in

Health & Safety Precautions

- Make sure that cables are safely secured
- Make sure that power points are not overloaded
- Also be aware of:
 - Repetitive Strain Injury (RSI)
 - Glare from screens
 - Bad posture

Value of Backup

- The most important thing that you store on your computer is information.
- Often the contents of a hard disk can represent years of work.
- If the hard disk stops working one day you could lose all those years of work.
- For this reason it is VITAL that you take regular backups of the information that is stored on the computer.

Value of Backup

- Organize your computer for more efficient backups
- Complete vs. incremental backups
- Use 'off-site' storage

Nitin Dawar, Delhi University Computer Centre nitin@ducc.du.ac.in

Value of Backup

- Use passwords
- Understand the Importance of shutting down your computer properly
- Use a UPS (Un-interruptible Power Supply)

Likes & Dislikes of Computer

• Things computer like:

- Good ventilation
- Clean environment
- Stable, vibration free surface

• Things computer don't like:

- Dust
- Drinking and eating over the keyboard
- Heat, Cold or Moisture
- Don't place objects on top of monitors.
- Don't place floppy disks near monitors.

Computer Virus

• What are computer viruses?

- Viruses are small programs that hide themselves on your disks (both diskettes and your hard disk).
- Unless you use virus detection software the first time that you know that you have a virus is when it activates.
- Different viruses are activated in different ways.

Computer Virus

• How do viruses infect PCs?

- Viruses hide on a disk and when you access the disk (either a diskette or another hard disk over a network) the virus program will start and infect your computer.
- The worst thing about a computer virus is that they can spread from one computer to another, either via use of infected floppy disk, or over a computer network, including the Internet.

Computer Virus

How to prevent virus damage

- There are a number of third party anti-virus products available.
- Most of these are better than the rather rudimentary products available within DOS and Windows, but of course you do have to pay for them!
- The main thing about your virus checker is that it should be kept up to date.
- Many companies supply updated disks on a regular basis or allow you to receive updates through an electronic, on-line bulletin board.

Software Copyright

- Be aware on software copyright issues
- Freeware
- Shareware
- What about software that you find on the Internet?
- Software site licenses

Software Copyright

- If your computer system holds information about individuals then you have a moral and legal duty to treat that information with respect.
- In a free society you have a right to ensure that information held about you is not abused.
- In many countries this right is enshrined under data protection laws

Just the beginning.....

We just touched on the very basics with this presentation! There is so much more to understanding computers. There are books that are thousands of pages long that explain how they work in great detail. But now maybe you understand them more than you did before and you'll want to keep learning.

Nitin Dawar, Delhi University Computer Centre nitin@ducc.du.ac.in
