Outline:

- Running Mathematica
- Getting Started
- Working with the Notebook Interface
- Getting Information from Mathematica
- The Mathematica System

Screenshot of a blank notebook

Using a Notebook Interface

- A purely graphical interface → double-click the Mathematica icon to start Mathematica.
- A textually based operating system → type the command Mathematica to start.
- An empty notebook with a blinking cursor → by default will interpret your text as input → type Shift+Enter to make Mathematica process your input.
- Shift+Enter tells Mathematica that you have finished your input.
If numeric keypad → its Enter key instead of Shift+Enter.
- After you send Mathematica input from your notebook, Mathematica will label your input with In[n]:= . It labels the corresponding output Out[n]= . Labels are added automatically.
- In[1]:= 2 + 2
Out[1]= 4
- notebooks are part of the "front end" to Mathematica.

```
2 + 2
```

```
4
```

```
3 - 5
```

```
-2
```

```
Solve[x^2 - 2 x + 1 == 0, x]
```

```
{{x -> 1}, {x -> 1}}
```

```
Plot[Tan[x], {x, 0, Pi}]
```

Getting Information about Mathematica Objects

- ?Log

This gives information on the built-in function Log.

Log[z] gives the natural logarithm of z (logarithm to base e).

Log[b,z] gives the logarithm to base b.

- ?Name show information on Name

??Name show extra information on Name

?Aaaa* show information on all objects whose names begin with Aaaa

- You can put * anywhere in the string you ask ? about. For example, ?*Expand would give you all objects whose names end with Expand. Similarly, ?x*0 would give you objects whose names start with x, end with 0, and have any sequence of characters in between.

In[2]:= ? Log

Log[z] gives the natural logarithm of z (logarithm to base e).
Log[b, z] gives the logarithm to base b. »

In[3]:= ?? Log

Log[z] gives the natural logarithm of z (logarithm to base e).
Log[b, z] gives the logarithm to base b. »

Attributes[Log] = {Listable, NumericFunction, Protected}

In[4]:= ? Export

Export["file.ext", expr] exports data to a file, converting it to the format corresponding to the file extension ext.
Export[file, expr, "format"] exports data in the specified format.
Export[file, exprs, elems] exports data by treating exprs as elements specified by elems. »

In[5]:= ?? Export

Export["file.ext", expr] exports data to a file, converting it to the format corresponding to the file extension ext.
Export[file, expr, "format"] exports data in the specified format.
Export[file, exprs, elems] exports data by treating exprs as elements specified by elems. »

MORE INFORMATION

EXAMPLES

Basic Examples (3)

Export an image object:

```
In[1]:= Export["landscape.jpg",
```

```
Out[1]= landscape.jpg
```

Export a plot as a GIF:

```
In[1]:= Export["test.gif", Plot[Sin[x], {x, 0, 10}]]
```

```
Out[1]= test.gif
```

Export a formula as a GIF:

```
In[1]:= Export["test.gif", Integrate[1/(x^4 - 1), x]]
```

```
Out[1]= test.gif
```

Warnings and Messages

- If it looks as if Mathematica is doing something you definitely did not intend, Mathematica will usually print a message to warn you.

e.g. the square root function should have only one argument.
Mathematica prints a message to warn you that you have given two arguments here.

- `In[1]:= Sqrt[4, 5]`

During evaluation of `In[1]:= Sqrt::argx: Sqrt called with 2 arguments; 1 argument is expected. >>`

`Out[1]= Sqrt[4, 5]`

- You can suppress the message for one evaluation using `Quiet`.

`In[2]:= Quiet[Sqrt[4, 5]]`

`Out[2]= Sqrt[4, 5]`

Interrupting Calculations

- There will probably be times when you want to stop Mathematica in the middle of a calculation. Perhaps you realize that you asked Mathematica to do the wrong thing. Or perhaps the calculation is just taking a long time, and you want to find out what is going on.
- The way that you interrupt a Mathematica calculation depends on what kind of interface you are using.
- Alt+, notebook interfaces
- Ctrl+C text-based interfaces

The Mathematica System

- Getting Used to Mathematica
- Differences between Computer Systems
- The Limits of Mathematica

Getting Used to Mathematica

■ Some Important Rules:

- Arguments of functions are given in square brackets.
- Names of built-in functions have their first letters capitalized.
- Multiplication can be represented by a space.
- Powers are denoted by ^.
- Numbers in scientific notation are entered, for example, as 0.00025 or $2.5 \cdot 10^{-4}$.

Some examples: Sin[x]

Each of these represents multiplication.

a*b a b a(b+1); 2 x means 2*x

- Uppercase and lowercase letters are recognized as different characters. Lists are wrapped with curly brackets.
- Commas are used to separate arguments.

N[Pi, 50];

Differences between Computer Systems

- *Elements of Mathematica that are exactly the same on all computer systems:*

The language used by the Mathematica kernel

The structure of Mathematica notebooks

The MathLink communication protocol

- *Elements that can differ from one computer system to another:*

The visual appearance of windows, fonts, etc.

Mechanisms for importing and exporting material from notebooks

Keyboard shortcuts for menu commands

- Communications between the kernel and the front end are handled by MathLink.

The Limits of Mathematica

- In just one Mathematica command, you can easily specify a calculation that is far too complicated for any computer to do. For example, you could ask for `Expand[(1+x)^(10^100)]`. The result of this calculation would have $10^{100}+1$ terms--more than the total number of particles in the universe.
- If your computer does run out of memory in the middle of a calculation, most versions of Mathematica have no choice but to stop immediately. As a result, it is important to plan your calculations so that they never need more memory than your computer has.
- Memory space is the most common limiting factor in Mathematica calculations. Time can also, however, be a limiting factor. You will usually be prepared to wait a second, or even a minute, for the result of a calculation. But you will less often be prepared to wait an hour or a day, and you will almost never be able to wait a year.

Core Language "How to" Topics

- [Create Definitions for Variables and Functions »](#)
- [Clear My Definitions »](#)
- [Map a Function over a List »](#)
- [Work with Pure Functions »](#)
- [Enter Ranges and Options for Functions »](#)

How to Create Definitions for Variables and Functions

- Here is a simple transformation rule. It says: whenever you see x , replace it by 3:

```
In[31]:= x = 3
```

```
Out[31]= 3
```

- The variable x has a value of 3.

```
In[32]:= x^2
```

```
Out[32]= 9
```

- Functions in Mathematica are defined by rules that act on patterns.

```
f[x_] := x^2
```

- The rule says: if you have f of any expression, replace it by that expression squared:

```
In[46]:= f[expr]
```

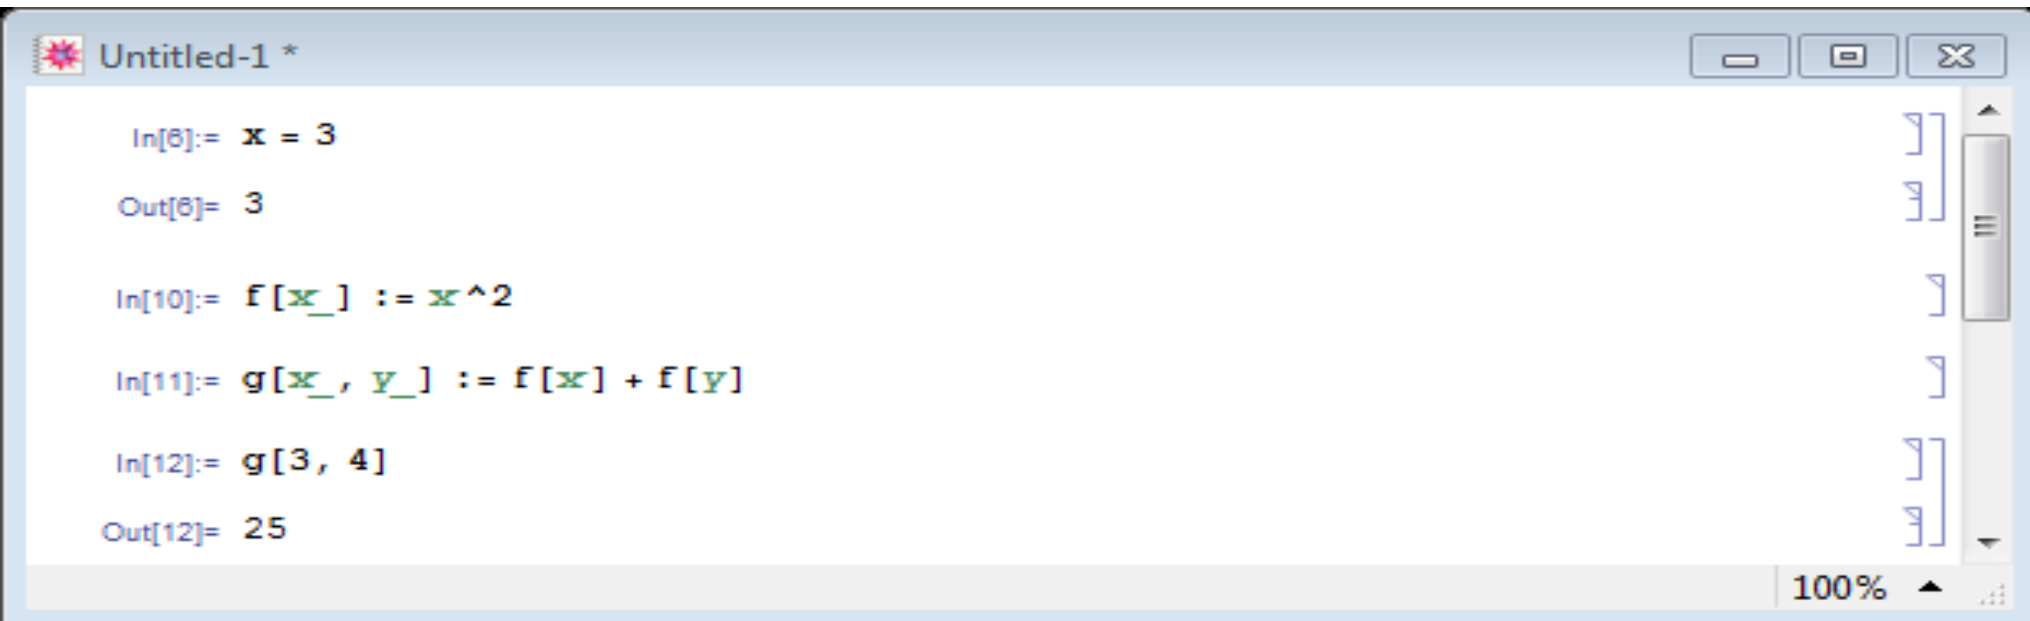

```
Out[46]= expr2
```

■ $g[x_, y_] := f[x] + f[y]$

In[49]:= $g[3, 4]$

Out[49]= 25

■ Always use `:=` to define functions, otherwise the variables on the right-hand side may not represent the associated expressions on the left-hand side, since they will be evaluated before the rule is defined.

```
Untitled-1 *  
  
In[6]:= x = 3  
Out[6]= 3  
  
In[10]:= f[x_] := x^2  
In[11]:= g[x_, y_] := f[x] + f[y]  
In[12]:= g[3, 4]  
Out[12]= 25
```

How to Clear Definitions

- When you set a value to a symbol, that value will be used for the symbol for the entire Mathematica session. Assign values to two symbols (x and y) and observe their sum:

```
In[3]:= x = 5;
```

```
y = 7;
```

```
x + y
```

```
Out[3]= 12
```

- Use Clear to clear the definitions for x and y:

```
Clear[x, y]
```

- Observe that x and y no longer have values associated with them:

```
In[5]:= Expand[(x + y)^2]
```

```
Out[5]= x2 + 2 x y + y2
```

- This command clears all the definitions made during the current Mathematica session:

```
Clear["Global`*"]
```

- Use `ClearAll` to clear not only the values and definitions of symbols but also the attributes and messages associated with them.
- You can also use `Unset (=.)` to clear any values or definitions made to a symbol:

```
In[20]:= x = 5
```

```
Out[20]= 5
```

```
x =.
```

```
?x
```

- `Remove` will remove a symbol completely until it is referenced again:

```
Remove[x]
```

```
?x
```

```
Information::notfound: Symbol x not found. >>
```

How to Map a Function over a List

- First set up a list of the integers from 1 to 5:

```
In[293]:= mylist = Range[5]
```

```
Out[293]= {1, 2, 3, 4, 5}
```

- You can map a function over every element of the list using Map;

```
In[294]:= Map[f, mylist]
```

```
Out[294]= {f[1], f[2], f[3], f[4], f[5]}
```

- Most mathematical functions have the Listable property:

```
In[297]:= Sin[mylist]
```

```
Out[297]= {Sin[1], Sin[2], Sin[3], Sin[4], Sin[5]}
```

- Map does not just operate on lists. It can be used for any expression:

```
In[301]:= Map[f, a + b + c + d]
```

```
Out[301]= f[a] + f[b] + f[c] + f[d]
```

- Apply is another functional programming operation. It replaces the head of an expression:
- You can see how this works using two undefined functions, f and g:

```
In[302]:= Apply[f, g[a, b, c, d]]
```

```
Out[302]= f[a, b, c, d]
```

```
■ In[304]:= {Plus[a, b, c], Times[a, b, c], List[a, b, c]}
```

```
Out[304]= {a + b + c, a b c, {a, b, c}}
```

```
■ In[305]:= Apply[Times, a + b + c]
```

```
Out[305]= a b c
```

- Mod finds the remainder when dividing the first number of an ordered pair by the second:

```
In[307]:= Mod[10, 4]
```

```
Out[307]= 2
```

1 / 1

73%

Find

```
In[18]: mylist = Range[2, 6]
```

```
Out[18]: {2, 3, 4, 5, 6}
```

```
In[24]: Range[10]
```

```
Out[24]: {1, 2, 3, 4, 5, 6, 7, 8, 9, 10}
```

```
In[26]: Clear[f]
```

```
In[27]: Map[f, mylist]
```

```
Out[27]: {f[2], f[3], f[4], f[5], f[6]}
```

```
In[28]: Sin[mylist]
```

```
Out[28]: {Sin[2], Sin[3], Sin[4], Sin[5], Sin[6]}
```

```
In[29]: Map[f, a + b + c + d]
```

```
Out[29]: f[a] + f[b] + f[c] + f[d]
```

```
In[30]: Apply[f, g[a, b, c, d]]
```

```
Out[30]: f[a, b, c, d]
```

```
In[31]: Apply[Times, a + b + c]
```

```
Out[31]: a b c
```

```
In[32]: Mod[10, 3]
```

```
Out[32]: 1
```

How to Work with Pure Functions

- The most transparent way to define a pure function is with `Function`. The first argument is a list of arguments, and the second is a function.

```
In[1]:= f = Function[{x, y}, x + y]
```

```
Out[1]= Function[{x, y}, x + y]
```

- In[2]:= `f[3, 4]`

```
Out[2]= 7
```

- You do not need to give the function a name to use it:

- In[3]:= `Function[{x, y}, x + y][3, 4]`

- Out[3]= 7

- In[4]:= `g = (#1 + #2) &`

```
Out[4]= #1 + #2 &
```

```
In[5]:= g[3, 4]
```

```
Out[5]= 7
```

- The advantage of a pure function is that it does not require a separate definition or a name:

```
In[6]:= (#1 + #2) &[3, 4]
```

```
Out[6]= 7
```

- If the pure function only has one argument, you can use # instead of #1. This function squares its argument:

```
In[7]:= #^2 &[3]
```

```
Out[7]= 9
```

```
Untitled-1 *  
File Edit Insert Format Cell Graphics Evaluation Palettes Window Help  
  
In[3]:= f = Function[{x, y}, x + y];  
In[4]:= f[3, 4]  
Out[4]= 7  
  
In[1]:= (#1 + #2) &[3, 4]  
Out[1]= 7  
  
In[2]:= #^2 &[3]  
Out[2]= 9  
  
25 100%
```

How to Enter Ranges and Options for Functions

- Here, $\text{Sin}[x]$ is the first argument in Plot , while the second argument $\{x, 0, 2\pi\}$ gives the variable and the range for the plot:

```
In[7]:= Plot[Sin[x], {x, 0, 2π}]
```

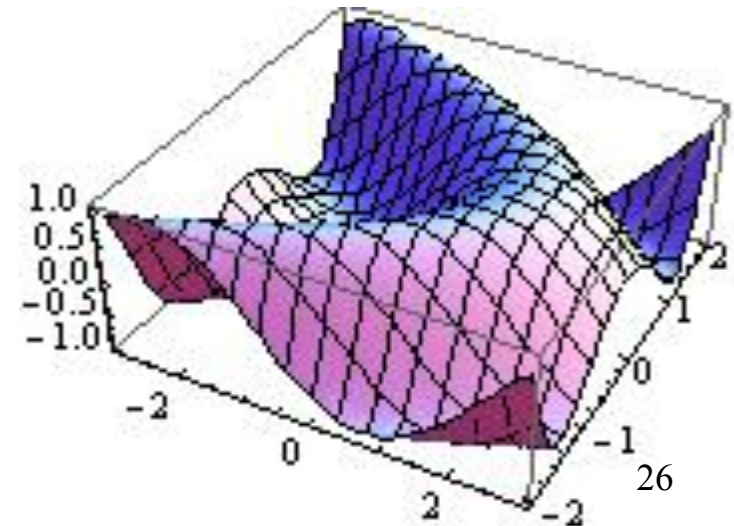

```
Out[7]=
```

- When plotting functions of two variables, the ranges for each variable are entered in the second and third arguments:

```
In[6]:= Plot3D[Sin[x + y^2], {x, -3, 3}, {y, -2, 2}]
```

```
Out[6]=
```

```
In[33]:= Plot[Sin[x], {x, 0, 2 π}]
```

```
In[35]:= Plot3D[Sin[x + y^2], {x, 0, π}, {y, 0, π}]
```

How to Create Lists

- Use the shorthand notation `{}` to make a list:

```
In[1]:= {2, 3, 5, 6}
```

```
Out[1]= {2, 3, 5, 6}
```

- Or use `List`, which automatically is changed to `{}`:

```
In[2]:= List[2, 3, 5, 6]
```

```
Out[2]= {2, 3, 5, 6}
```

- Use `Range` with one argument to create a list of integers starting at 1:

```
In[3]:= Range[10]
```

```
Out[3]= {1, 2, 3, 4, 5, 6, 7, 8, 9, 10}
```

```
In[4]:= Range[5, 10]
```

```
Out[4]= {5, 6, 7, 8, 9, 10}
```

```
In[5]:= Range[5, 10, 1/2]
```

```
Out[5]= {5, 11/2, 6, 13/2, 7, 15/2, 8, 17/2, 9, 19/2, 10}
```

■ In[6]:= Range[10]^2

Out[6]= {1, 4, 9, 16, 25, 36, 49, 64, 81, 100}

■ In[7]:= Table[i^2, {i, 10}]

Out[7]= {1, 4, 9, 16, 25, 36, 49, 64, 81, 100}

■ In[9]:= NestList[f, x, 3]

Out[9]= {x, f[x], f[f[x]], f[f[f[x]]]}

■ In[10]:= Array[f, 4]

Out[10]= {f[1], f[2], f[3], f[4]}

■ Use List to create lists of strings:

■ In[12]:= List[{"a", "b", "c"}, {"you", "are", "good"}]

Out[12]= {{ "a", "b", "c"}, {"you", "are", "good"}}

- A matrix in Mathematica is a list of lists.
- Use `RandomInteger` to create a 4x4 matrix of random integers between 0 and 10 (stored as `m`):

■ `In[13]:= m = RandomInteger[10, {4, 4}]`

`Out[13]= {{5, 0, 2, 5}, {3, 2, 8, 6}, {9, 9, 8, 0}, {2, 2, 3, 4}}`

- Use `MatrixForm` to see `m` as a 2D matrix:

■ `MatrixForm[m]`

`Out[14]//matrixform=`

$$\begin{pmatrix} 5 & 0 & 2 & 5 \\ 3 & 2 & 8 & 6 \\ 9 & 9 & 8 & 0 \\ 2 & 2 & 3 & 4 \end{pmatrix}$$

- You can directly apply math functions to a list:

`In[15]:= Sqrt[{1, 2, 3, 4}]`

`Out[15]= {1, $\sqrt{2}$, $\sqrt{3}$, 2}`

In[16]:= 1 + {{a}, {a, b}, {a, b, c}}^2

Out[16]= {{1 + a²}, {1 + a², 1 + b²}, {1 + a², 1 + b², 1 + c²}}

■ In[17]:= Max[{1, 2, 3, 4}]

Out[17]= 4

■ In[18]:= Length[{a, b, c}]

Out[18]= 3

■ This uses Map to apply Length to each sublist:

■ In[20]:= Map[Length, {{a}, {a, b}, {a, b, c}}]

Out[20]= {1, 2, 3}

How to Get Elements of Lists

■ In[256]:= v = Range[10]^2

Out[256]= {1, 4, 9, 16, 25, 36, 49, 64, 81, 100}

■ In[257]:= Part[v, 3]

Out[257]= 9

■ In[260]:= v[[5 ;; 8]]

Out[260]= {25, 36, 49, 64}

■ In[261]:= v[[-7 ;;]]

Out[261]= {16, 25, 36, 49, 64, 81, 100}

■ You can pick out elements from a matrix just like you would from a list.

■ In[262]:= m = Partition[Range[25]^2, 5]

Out[262]= {{1, 4, 9, 16, 25}, {36, 49, 64, 81, 100}, {121, 144, 169, 196, 225}, {256, 289, 324, 361, 400}, {441, 484, 529, 576, 625}}

■ In[264]:= m[[1]]

Out[264]= {1, 4, 9, 16, 25}

File Edit Insert Format Cell Graphics Evaluation Palettes Window Help

```
In[14]:= m = Partition[Range[25]^2, 5]
```

```
Out[14]= {{1, 4, 9, 16, 25}, {36, 49, 64, 81, 100}, {121, 144, 169, 196, 225},  
          {256, 289, 324, 361, 400}, {441, 484, 529, 576, 625}}
```

```
In[15]:= MatrixForm[m]
```

```
Out[15]//MatrixForm=
```

$$\begin{pmatrix} 1 & 4 & 9 & 16 & 25 \\ 36 & 49 & 64 & 81 & 100 \\ 121 & 144 & 169 & 196 & 225 \\ 256 & 289 & 324 & 361 & 400 \\ 441 & 484 & 529 & 576 & 625 \end{pmatrix}$$

How to Combine and Rearrange Lists

```
In[1]:= v = {3, 1, 3, 2, 5, 4}
```

```
Out[1]= {3, 1, 3, 2, 5, 4}
```

```
In[2]:= Sort[v]
```

```
Out[2]= {1, 2, 3, 3, 4, 5}
```

Use `Union` to sort `v` and remove any duplicates:

```
In[3]:= Union[v]
```

```
Out[3]= {1, 2, 3, 4, 5}
```

```
In[5]:= v = Union[v]
```

```
Out[5]= {1, 2, 3, 4, 5}
```

```
In[7]:= Reverse[v]
```

```
Out[7]= {5, 4, 3, 2, 1}
```

```
In[11]:= Partition[v, 2]
```

```
Out[11]= {{1, 2}, {3, 4}}
```

```
In[15]:= Join[{a, b}, {c, d, e}, {f, g, h}]
```

```
Out[15]= {a, b, c, d, e, f, g, h}
```

How to Perform Operations on Lists

You can add two lists of the same length element by element:

```
In[49]:= {a, b} + {x, y}
```

```
Out[49]= {a + x, b + y}
```

```
In[50]:= c + {a, b}
```

```
Out[50]= {a + c, b + c}
```

```
In[51]:= k {a, b}
```

```
Out[51]= {a k, b k}
```

```
In[43]:= v = Range[5]
```

```
Out[43]= {1, 2, 3, 4, 5}
```

```
In[45]:= Append[v, x]
```

```
Out[45]= {1, 2, 3, 4, 5, x}
```

```
In[44]:= Prepend[v, x]
```

```
Out[44]= {x, 1, 2, 3, 4, 5}
```

```
In[46]:= Insert[v, x, 3]
```

```
Out[46]= {1, 2, x, 3, 4, 5}
```

How to Create and Use Rules

- The short form for a rule uses a right arrow, which you get by typing `->`
- Use `/.` to use a rule with an expression:

```
In[57]:= 2 x + 1 /. x -> 3
```

```
Out[57]= 7
```

- `In[59]:= 2 x + y /. {x -> 3, x -> 4}`

```
Out[59]= 6 + y
```

- You can also use a rule to replace larger parts of an expression:

```
In[62]:= 9 + x^2 - 9 x^3 /. x^2 - 9 x^3 -> 3 y
```

```
Out[62]= 9 + 3 y
```

- `In[18]:= 1 + f[x] + f[y] /. f[x_] -> x^2`

```
Out[18]= 1 + x^2 + y^2
```

How to Use Rule Solutions

■ In[77]:= t = Solve[x^2 == 9, x]

Out[77]= {{x -> -3}, {x -> 3}}

■ In[2]:= v = Solve[{x^2 + y^2 + z^2 == 9, y == x, y == z}, {x, y, z}]

Out[2]= {{x -> -√3, y -> -√3, z -> -√3}, {x -> √3, y -> √3, z -> √3}}

■ eqn = x^2 + 2 a x + 1 == 0;

In[97]:= sol = Solve[eqn, x]

Out[97]= {{x -> -a - √-1 + a^2}, {x -> -a + √-1 + a^2}}

■ Plot[x /. sol, {a, -5, 5}]

Out[70]=

Thank You
